Power semiconductors

 **Hitachi Energy**

Our power electronics journey started in Switzerland over 100 years ago with the production of mercury-arc rectifiers. Today, we have one of the most diverse semiconductor portfolios that includes thyristors, diodes, GTOs, IGCTs, MOSFETs and IGBTs, which are manufactured at our own facilities in Lenzburg, Switzerland and Prague, Czech Republic. Our research team continues to push the boundaries of what is possible, using silicon (Si) and silicon carbide (SiC) technology to innovate the next generation of power electronics devices.

Our advanced semiconductor technology brings unprecedented control to HVDC transmission systems. We are the heart of traction converters that drive high speed trains, metros and diesel-electric locomotives. Pumps, fans, roller tables, hoist and winches found throughout industry rely on us, and the world is able to enjoy greener mobility because we power the next generation of e-vehicles.

We are Hitachi Energy – Semiconductors and with you we can shape the smarter, greener society of the future.

Product outlook

RoadPak XS

A new RoadPak with a smaller footprint for the 750 V and 1200 V classes will be available for sampling in the third quarter of 2022. It completes the RoadPak portfolio, supporting a lower current rating of 2 x 440 A and can be used in a wide range of applications due to its compact size and optimized high-performance design.

Ratings

Availability	Voltage (V)	Current (A)	Housing
750 V phase leg MOSFET, samples available Q3/2022	750	2 x 440	RoadPak
1200 V phase leg MOSFET, samples available Q3/2022	1200	2 x 440	RoadPak

StakPak BIGT and IGBT

The Hitachi Energy StakPak is the industry standard for highest power grid infrastructure applications. It earned its place by offering unmatched reliability combined with the highest power density and mechanical robustness. At the same time, StakPak benefits from a novel solution that combines the IGBT and the free-wheeling diode into a single chip, the BIGT. This enables greater power cycling capability and increases current density. During 2022 Hitachi Energy will launch the BIGT2, a second generation of this chip, that delivers a 30% improvement in current density.

To support the never-ending quest to increase the power rating and the efficiency of the HVDC stations, Hitachi Energy will deliver a StakPak with an unprecedented current rating of 5000 A.

LoPak 1200 V, 1700 V

New 1200 V class LoPak modules are now available, completing the portfolio with high current ratings of 2 x 600 A and 2 x 900 A. Their compact size and optimized high-performance design mean they are ideal for a wide variety of applications. Further extending the existing LoPak 1700 V portfolio, a new, more powerful 1700 V module rated at 2 x 600 A, which benefits from the newly launched Trench Fine Pattern (TFP) chip technology, will be added.

Ratings

Availability	Voltage (V)	Current (A)	Housing
1200 V 600 A phase leg IGBT, samples available	1200	2 x 600	LoPak1
1200 V 900 A phase leg IGBT, samples available	1200	2 x 900	LoPak1
1700 V 600 A phase leg IGBT, samples available Q3 2022	1700	2 x 600	LoPak1

High-voltage LinPak

After establishing a standard with the low-voltage LinPak, Hitachi Energy is offering a high isolation version of this module. Like its LV version, it features very low stray inductance, highest current density, ideal current sharing and very good paralleling capability. The line-up expands from 3.3 kV to 6.5 kV.

Voltage (V)	Current (A)
3300	600
4500	450
6500	300

Low-Voltage LinPak with new chipset

The LV 1700 V 1000 A LinPak has been deployed in trains and industrial systems for more than five years. With the help of a new generation of chip, Hitachi Energy now supports current ratings of 1500 A in the same footprint. The chipset is based on the newly-launched Trench Fine Pattern (TFP) technology, developed to enable very high current density and superior trench gate robustness.

Ratings

Availability	Voltage (V)	Current (A)	Housing
1700 V 1000 A TFP technology, samples available Q2 2022	1700	2 x 1000	LV LinPak
1700 V 1500 A TFP technology, samples available Q2 2022	1700	2 x 1500	LV LinPak

FlexyPak

With the introduction of the FlexyPak, Hitachi Energy expands its portfolio in the lower range of high power semiconductors. The package provides unmatched internal design flexibility, allowing a variety of topologies including single, dual, chopper and Vienna to be implemented. Furthermore, the direct pin connection of the FlexyPak ensures the lowest stray inductance for a module in its class, enabling the use of novel Wide Band Gap (WBG) semiconductors in these new modules.

Ratings

Availability	Voltage (V)	Current (A)	Housing
1200 V 110 A with SiC MOSFET, samples available Q3 2022	1200	2 x 110	FlexyPak1
1200 V 220 A with SiC MOSFET, samples available Q3 2022	1200	2 x 220	FlexyPak1

Thyristor / diode modules

All thyristor / diode modules feature industry standard housings and very low losses together with the highest operating temperatures.

Typical applications are AC motor soft starters, variable speed drives and renewable energies. Features within high-power semiconductors are also used in our thyristor/diode module product line.

The benefits of these features include highest performance, outstanding reliability, increased overload capability and many

Target ratings 50Pak and 60Pak

more. The 60Pak diode-diode (DD) module rated at 2200 V is now fully qualified and available in volume, while the thyristor and thyristor / diode hybrid modules are available in sample quantities (for more details see page 29). The lineup will be expanded rapidly with support for different voltages and other configurations over the next few years.

Voltage (V)	Package	Configuration
TT Thy/Thy		
DD Dio/Dio		
DT Dio/Thy		
TD Thy/Dio		
6000	60Pak	DD
5000	60Pak	DD
2200	50, 60Pak	DD
1800	50, 60Pak	TT, DD, DT, TD

2500 V reverse-blocking IGCT

With the introduction of the newly developed 2.5 kV reverse-blocking Integrated Gate Commutated Thyristors (RB-IGCT), another powerful device is added to the successful and well-established IGCT product line.

The RB-IGCT is optimized for the lowest conduction losses and highest turn-off current capability. The conduction losses are reduced to less than 1000 W at 1000 A, a record low value for a power semiconductor device in this class.

To achieve the highest turn-off current capability of 5600 A, the well known and proven HPT® platform is used. Due to its outstanding performance, efficiency and reliability, the new RB-IGCT is the ideal device for Solid State Circuit Breakers (SSCB) used in renewables, transport electrification and modern edge grids.

Rating of 2500 V, RB-IGCT

Device	Availability	Voltage (V)	Turn-off current (A)	Housing
RB-IGCT	Samples available	2500	5600	L size

Applications

Hitachi Energy's semiconductors are key components in a variety of demanding applications in markets like power transmission & distribution, industry, mobility and renewable energy. Customers rely on Hitachi Energy's high quality power semiconductor products and use them in applications in power ranges from 50 kW to 10 GW.

© ABB

- 1 Power transmission and distribution (HVDC, FACTS, STATCOM and others)
- 2 Industry (medium and low-voltage drives, soft starters, UPSs, high-power rectifiers, excitation systems and others)

- 3 Mobility (rail and subway main and auxiliary drives, trackside power supply / electrical vehicles)
- 4 Renewable energy (converters for pumped hydro, wind turbines and solar)

SEMIS

Semiconductor power loss simulation tool

SEMIS is Hitachi Energy's power loss simulation tool.

This web application enables the selection of the optimal high-power semiconductor by considering thermal losses and device utilization with various topologies, circuit parameters and control strategies to fit customer specific needs.

By selecting the topology and defining the relevant circuit and control parameters, SEMIS analyzes multiple system dependencies. Power losses as well as thermal conditions are evaluated, enabling the verification of semiconductors' device capabilities under various conditions.

Topologies

Available topologies are listed in the respective sub-categories DC-DC, Voltage Source and Current Source converters. Please select according to your requirement.

Analysis completed.

High power semiconductor applications are highly complex and, to reduce prototyping, require thermal loss evaluation prior to a detailed circuit analysis to find the best possible semiconductor for customized settings and conditions. More than 35 topologies are listed according to application fields or grouped as Voltage Source (VSC), Current Source (CSC) and DC-DC converters. By selecting the topology circuit, the list of definable settings is indicated, enabling the highest flexibility in the definition of the system parameters.

To start the simulation, circuit parameters are defined according to the user specification with significant flexibility enabling the simulations to be adapted to customer needs. With the selection of one or more Hitachi Energy products, the system is ready for analysis.

The thermal impedance path, conduction and switching losses of each element of the topology as well as the control strategy are considered for the calculation of junction temperatures. This reveals critical elements or thermal paths enabling optimizations with the initial approach.

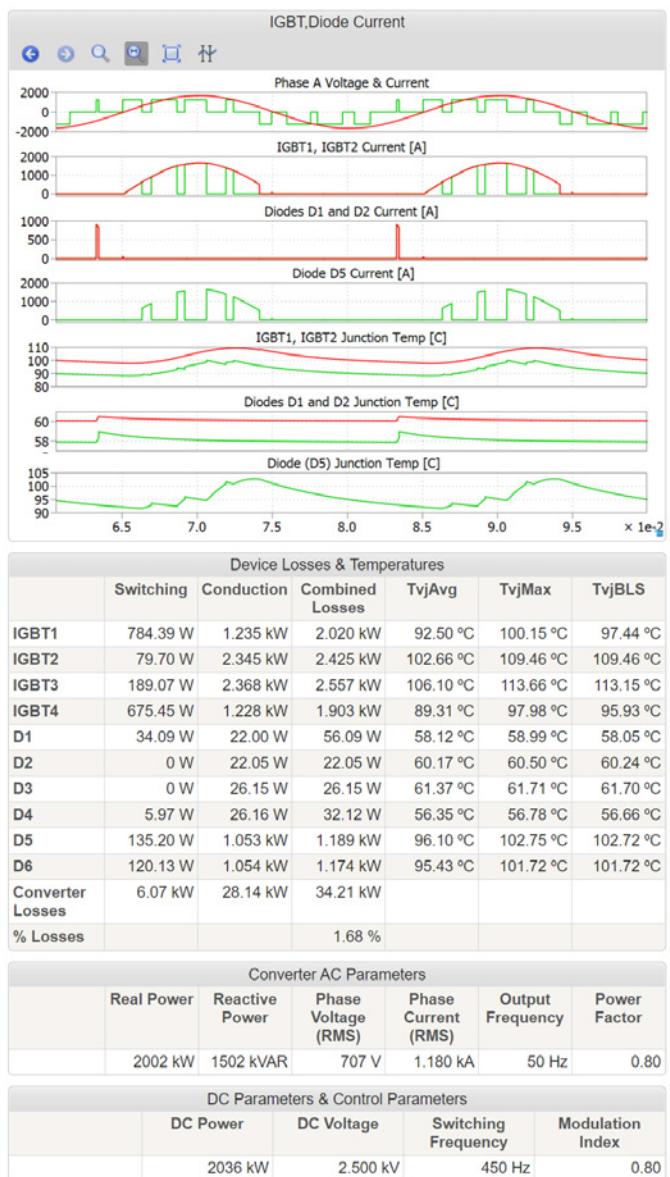

The simulator uses Jacobian steady-state analysis to calculate the on-state and dynamic power losses, as well as the resulting thermal variations of semiconductors. If junction temperatures exceed the permissible limits, alert messages are generated to ensure a safe operating area for the specific semiconductor.

Detailed results are displayed as graphs, indicating the thermodynamic and electrical static behavior of each power semiconductor. With the phase voltage and current, the combined converter output is indicated.

For detailed analysis, semiconductor specific parameters are tabulated, enabling numerical analysis of each element and parameter for conduction and switching power losses and junction temperatures. Critical elements with the highest thermal load are discovered rapidly, leading to efficient optimization in relation to cost efficiency, power losses and cooling system. For verification of the system efficiency, the converter power effectiveness and the system efficiency are indicated. This reveals the power loss influence of the applied semiconductors in combination with the control strategy. By comparing multiple products and parameter combinations, the influence of varying parameters is revealed.

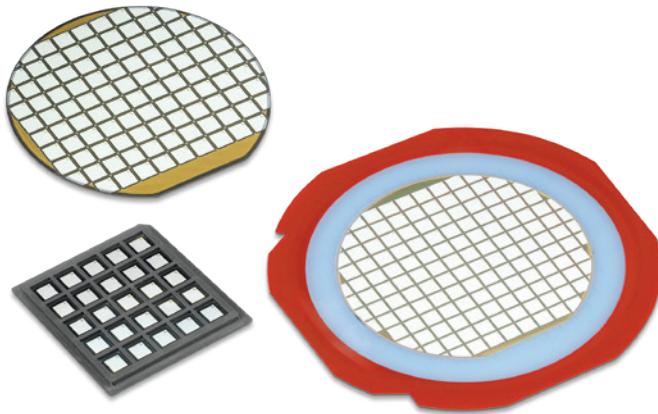

By providing an efficient and reliable product analysis according to customer requirements, a tailor-made selection of Hitachi Energy products can be made with ease. For customer simulations with more specific topologies and control strategies, the model's data is available for download from Hitachi Energy's website. This enables simulation to the highest customization and adaptation of control strategies.

Simulations exceeding the capabilities of the online SEMISS tool and for simulations of higher complexity, please contact your Hitachi Energy sales agent or Hitachi Energy - Semiconductors - for further support.

IGBT and diode dies

When looking for chipsets featuring highest switching performance, ruggedness and reliability, Hitachi Energy's IGBT chips with accompanying diodes are certainly the preferred choice.

Hitachi Energy's SPT (Soft Punch Through) chipsets and their improved versions with lower losses (SPT⁺ and SPT⁺⁺) are available at 1200 V and 1700 V. They feature highest output power per rated ampere due to a moderate chip shrinkage and thus larger die area compared to others. Additionally to these well-established planar chip technologies, starting 2022, Hitachi Energy will add a new chipset based on the recently developed Trench Fine Pattern (TFP) technology.

Typical applications for 1200 V are power converters for industrial drives, solar energy, battery backup systems (UPS) and electrical vehicles. Applications for 1700 V also include industrial power conversion & drives, wind turbines and traction converters.

Hitachi Energy's 1700 V SPT⁺⁺ chipset is the world's first 1700 V chipset that offers an operational junction temperature of up to 175 °C. This allows the module designer to increase the power density of the IGBT modules significantly.

Medium-power IGBT modules

Hitachi Energy enhances its successful IGBT module range into the medium-power segment. Starting with the 62Pak and the LoPak1, Hitachi Energy brings the proven high quality and reliability of the HiPak modules to the medium-power IGBT segment.

Hitachi Energy's 62Pak modules have an advanced packaging technology that leverages the performance of the latest silicon technology:

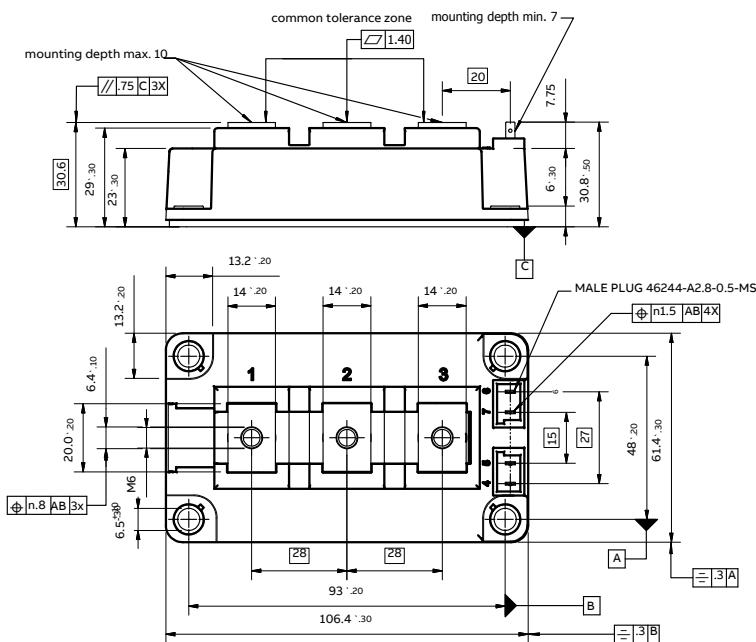

- 1700 V SPT++ fast switching IGBT / diode chipset with lowest switching losses
- Full 175 °C operation temperature with full square SOA
- Best-in-class temperature cycling performance of bond-wire chip connection
- Standard package allowing drop-in replacement

Q

Dimensions in mm

Hitachi Energy's LoPak is 100 % mechanically compatible with the Econo-type dual IGBT modules. It sets a new benchmark with full switching performance up to 175 °C. It is specifically designed for excellent internal current sharing, offering optimal thermal utilization and increased robustness.

In addition, we offer LoPak 1700 V with an optional feature: the pre-applied Thermal Interface Material (TIM). The use of TIM improves the thermal conduction at the module baseplate/heatsink interface ensuring more stability over long-term operation. Typical applications include:

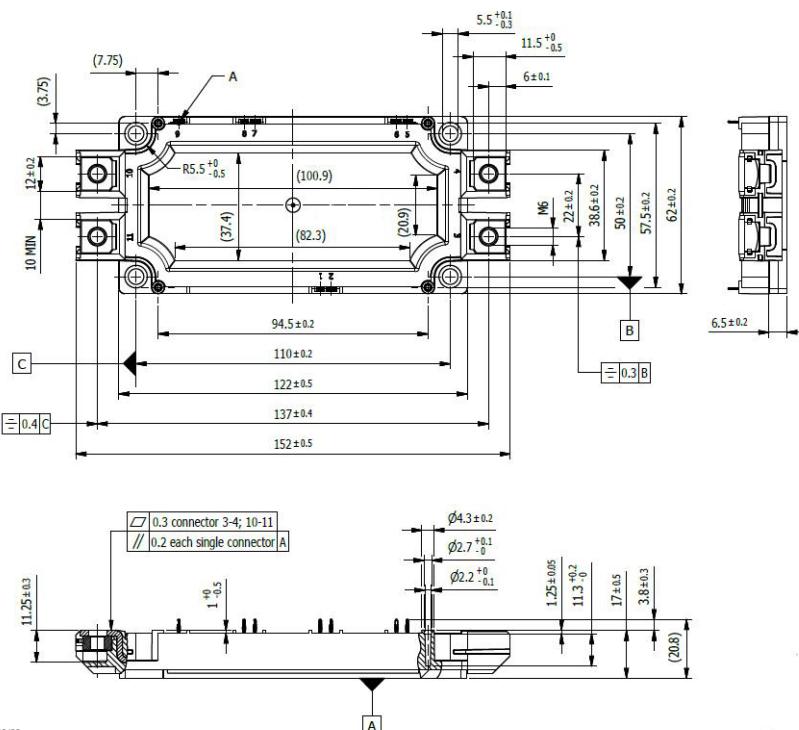

- Wind power converters
- Variable speed drives
- Power supplies
- Power quality
- UPS

Power IGBT/MOSFET and diode modules

Hitachi Energy offers three categories of high-power IGBT and diode modules: Insulated, press-pack and the newly launched SiC modules for e-mobility applications.

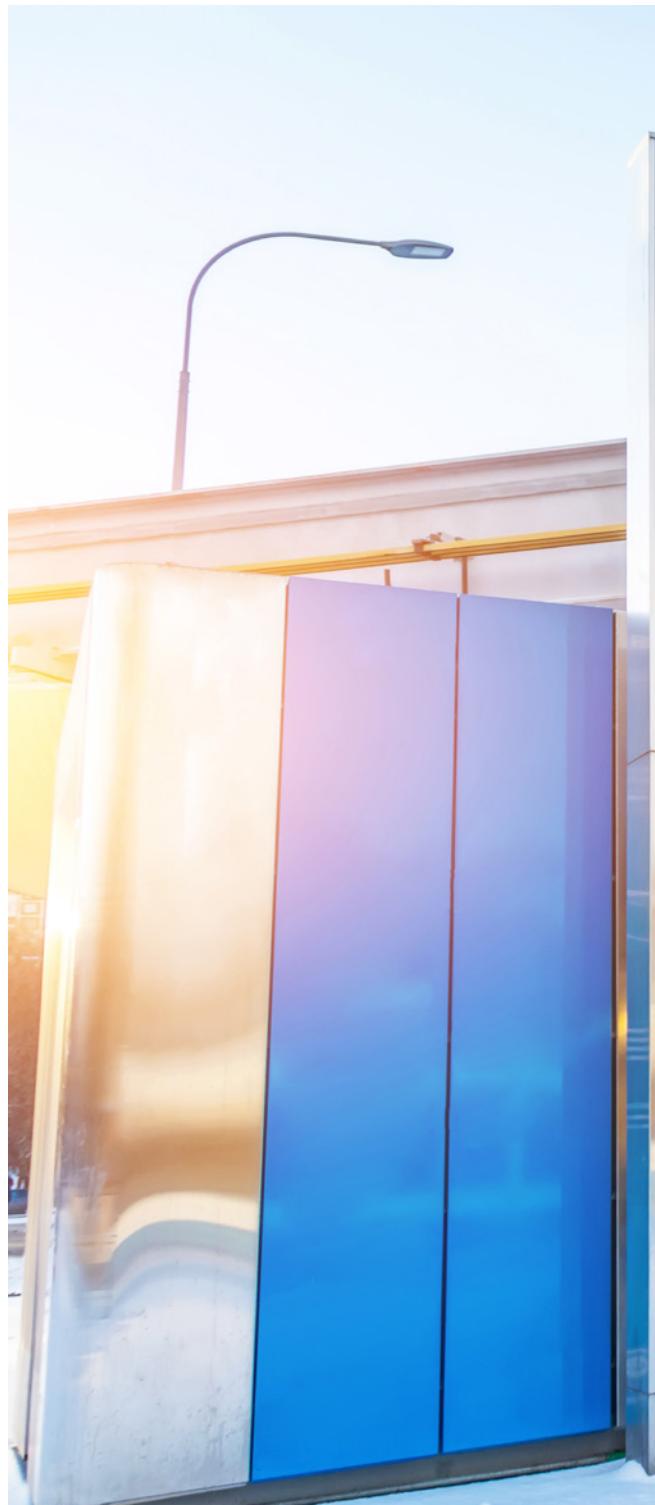

Insulated modules consist of the new innovative, low inductive phase leg LinPak and the well-established HiPak lineup with more than 15 years and more than 1 million modules in the field.

Press-pack modules are a range of pressure contact IGBT modules also known as StakPak. StakPaks are Hitachi Energy's flagship products with record power ratings up to 5200 V and more than 3000 A.

The new e-mobility module portfolio takes advantage of silicon carbide (SiC) technology, offering benefits like high-current rating in a small package and a with very low stray inductance.

Hitachi Energy's power IGBT and diode module families are:

- RoadPak modules page 18
- LinPak IGBT & SiC MOSFET modules page 20
- HiPak IGBT and diode modules page 22
- StakPak IGBT press-pack modules page 26

RoadPak SiC e-mobility module

The RoadPak is our newest innovative solution for all e-mobility applications. It enables the design of converters with lowest overall stray inductance, thanks to the latest generation of SiC MOSFET chipset and enhanced liquid cooling performance due to its pin-fin baseplate.

RoadPak applications include amongst others main drive train for xEVs, e-trucks, e-busses, traction auxiliary converters, as well as power electronics for xEV-charging. In addition, the RoadPak allows very easy low inductive connections and supports several numbers of parallel chips, thus the current rating of the inverters can be scaled up with just one module type. This allows the use of RoadPak in a well defined converter portfolio based on various performance classes.

Thanks to its exceptional low stray inductance (5 nH), the RoadPak is the ideal package to deliver the full potential of high-power SiC devices. Additionally, Hitachi Energy offers optimized gate units for the RoadPak, as well as a cooler for three devices in a 3-phase inverter configuration. Our RoadPak modules feature the lowest switching losses, highest performance and excellent robustness, while supporting two chipsets: our own Hitachi Energy chipset and an external chipset to reduce supply chain challenges and ensure product availability.

On request:

- Optimized gate unit
- Cooler for 3-phase inverter design

LinPak IGBT & SiC MOSFET modules

The LinPak is a new innovative solution for all power conversion applications. It enables the design of converters with lowest overall inductance, thus fast low switching loss chipsets can be used for the first time also in high-current applications.

These applications include amongst others traction, converters for wind turbines or other renewables, industrial drives, as well as power electronics for FACTS applications. In addition, the LinPak allows very easy parallel connection, thus the current rating of the inverters can be scaled up with just one part number.

This makes the supply chain and initial device design-in efforts significantly more efficient.

Thanks to its exceptional low stray inductance, the LinPak is the ideal package to demonstrate the performance of high-power SiC. Hitachi Energy offers a SiC demonstrator module for customers to evaluate the SiC performance.

Hitachi Energy's LinPak modules feature lowest switching losses and excellent robustness thanks to its low inductance.

HiPak IGBT and diode modules

Demanding high-power applications such as traction inverters, medium-voltage drives, wind turbine converters, HVDC or FACTS are looking for the highest reliability IGBT modules.

Hitachi Energy's HiPak family of IGBT modules is the best fit to demanding applications, continuing to set new standards of robustness.

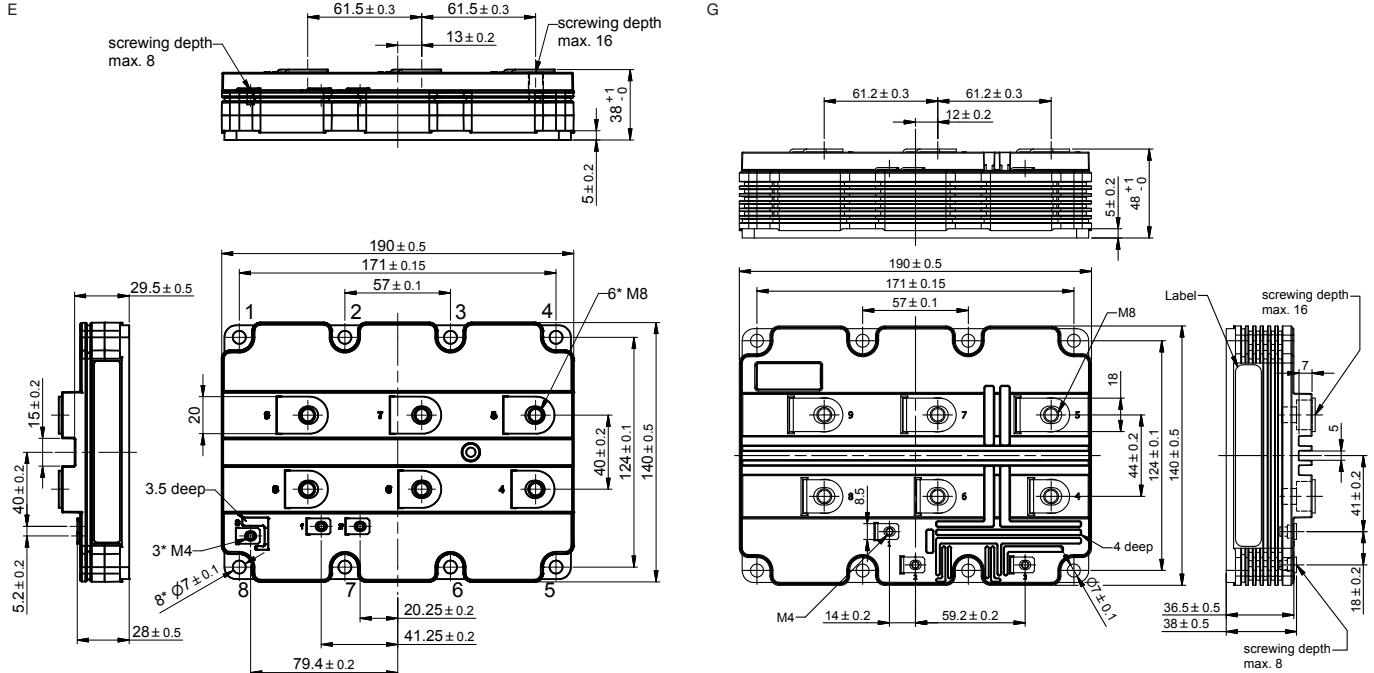

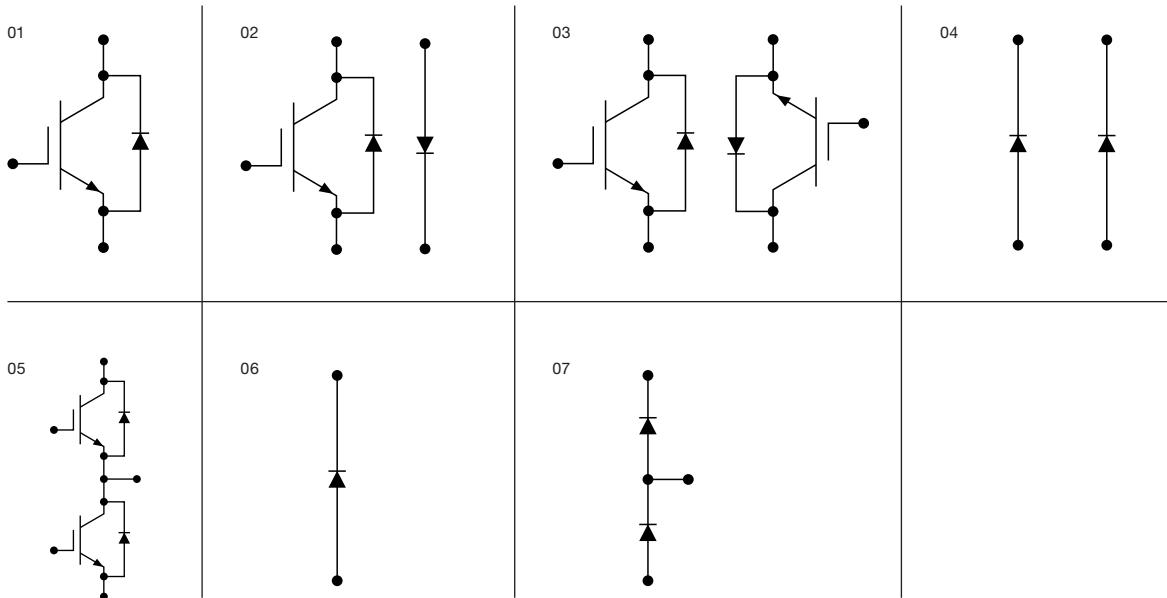

Hitachi Energy's HiPak IGBT modules are available from 1700 V to 6500 V in various configurations. They all feature low losses combined with soft-switching performance and record-breaking Safe Operating Area (SOA).

StakPak IGBT press-pack modules

To enhance reliability and reduce cost in systems that require redundancy and series connected IGBT modules, one should consider using Hitachi Energy's StakPaks.

Hitachi Energy's StakPak family uses a well proven concept in IGBT press-pack technology that:

- allows for easy mechanical and electrical series connection
- allows for easy stack design thanks to high tolerance for inhomogeneous mounting pressure
- guarantees a uniform chip pressure in multiple-device stacks
- provides a stable shorted state in case of failure
- long-term short-circuit failure mode (SCFM) available

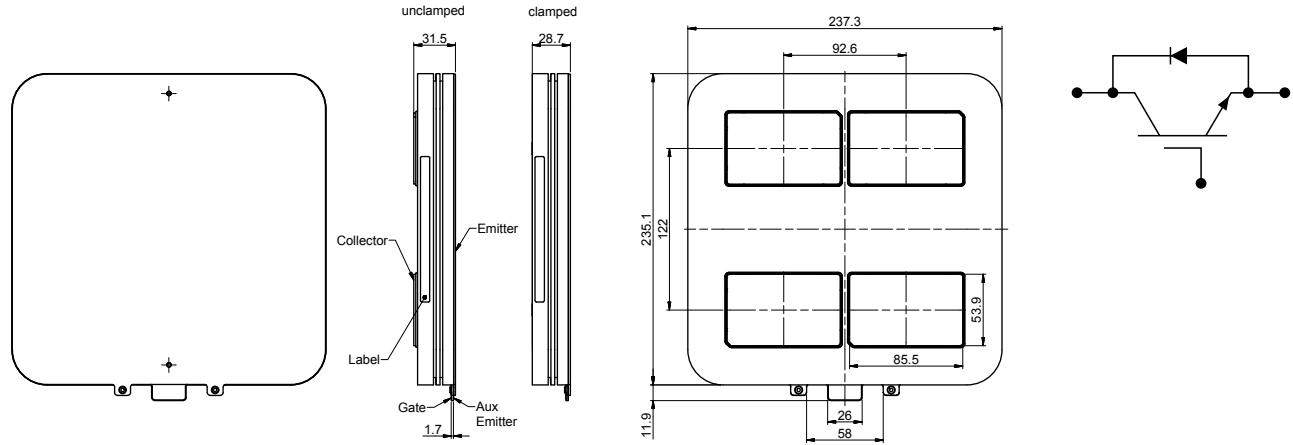

Hitachi Energy's StakPak IGBT modules are therefore a perfect match for applications like HVDC, FACTS, breakers and pulsed power.

Diode and thyristor modules

60Pak

Hitachi Energy's diode and thyristor modules feature industry standard housings and very low losses together with the highest operating temperatures.

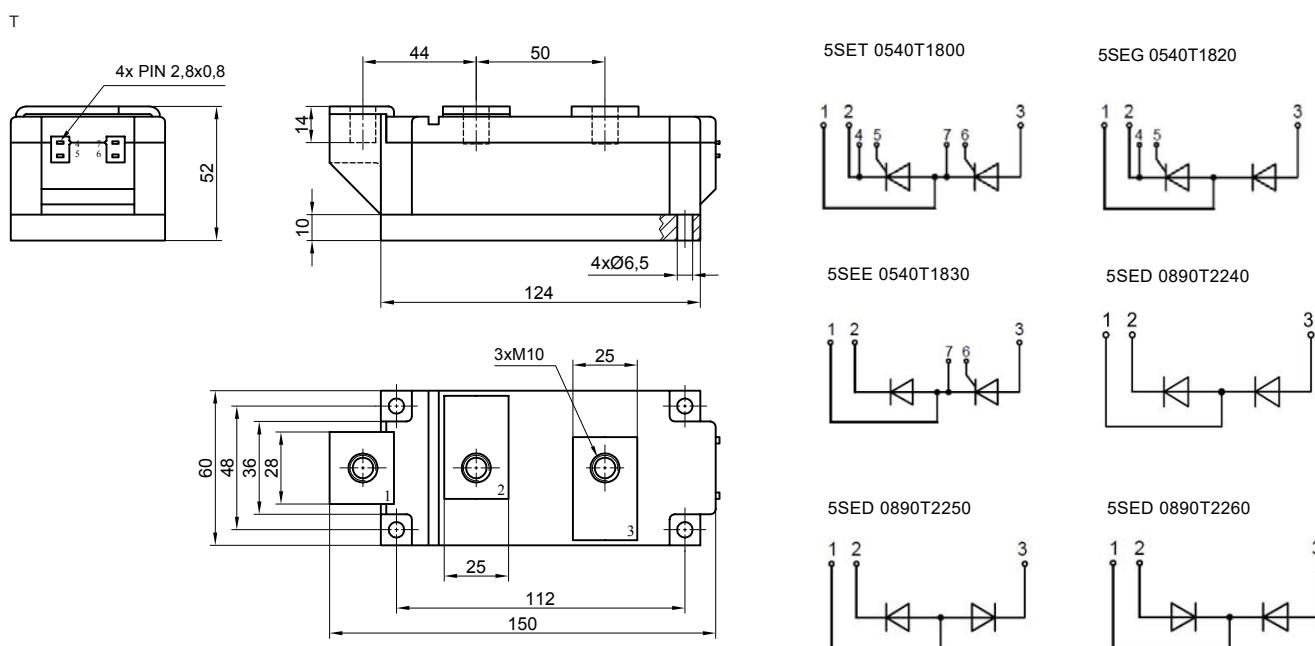

They provide the ultimate in reliability and are the epitome of quality. Whether efficiently driving industrial motors, smoothly accelerating fans and pumps, or supply power to demanding applications. The key benefits of the new 60Pak module are highest performance, outstanding reliability and increased overload capability. All highest quality Hitachi Energy's assets wrapped in a standard industrial housing

Diodes

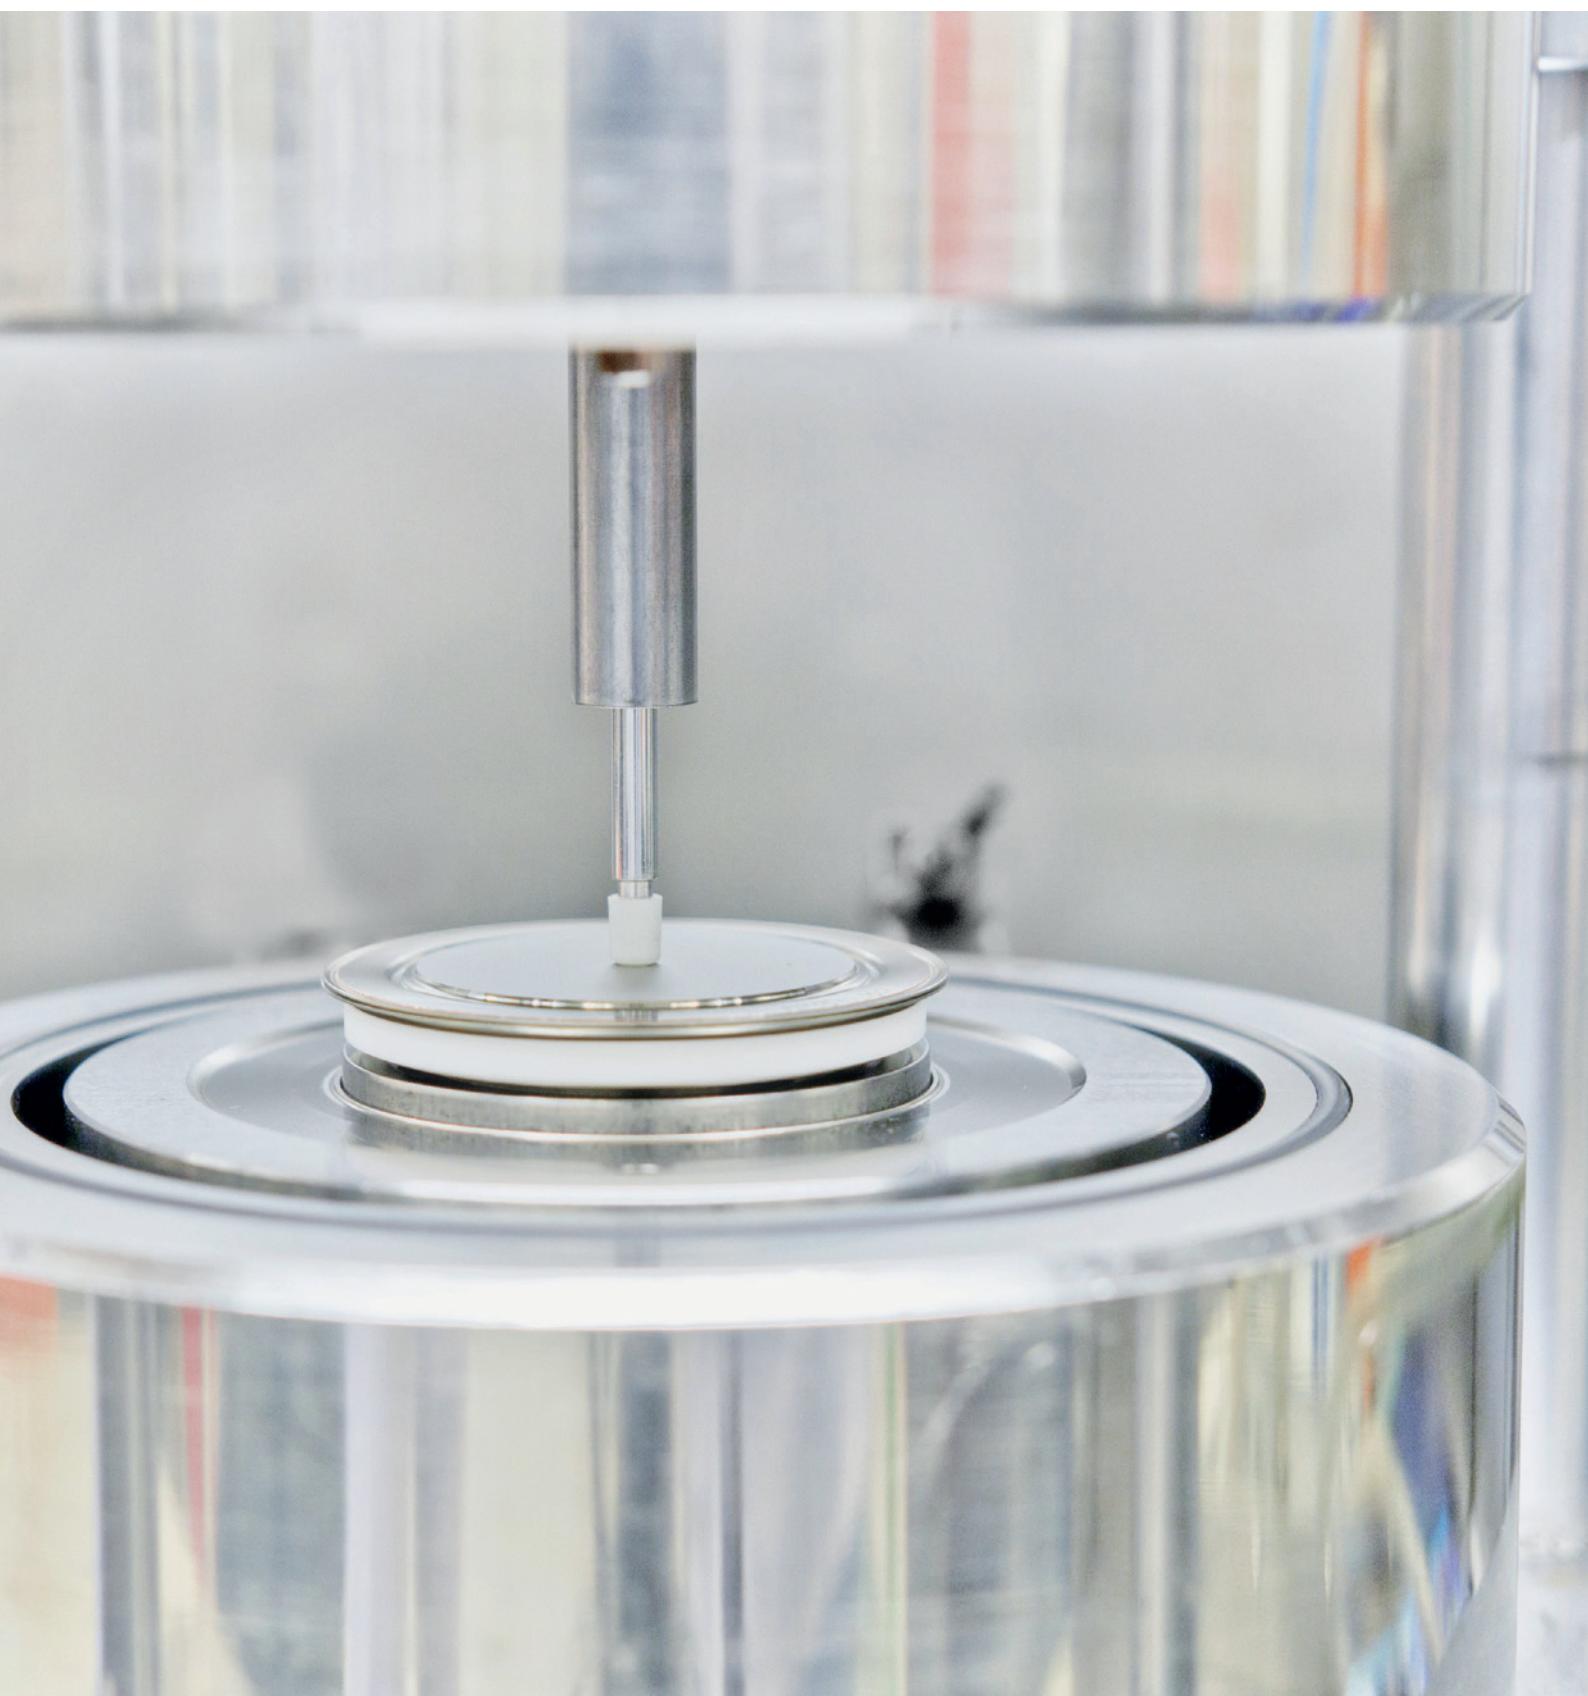

Diodes are used in a number of different applications. Each of these applications sets different requirements on the diodes' characteristics.

Inverter applications ask for fast recovery diodes with soft-switching characteristics, high-current rectifiers demand diodes with low on-state losses, medium-power rectifiers benefit from diodes with avalanche capability and welding rectifiers require highest current in the smallest package.

Hitachi Energy offers four press-pack diode families that meet these requirements:

- Fast recovery diodes page 32
- Standard rectifier and avalanche diodes page 34
- Welding diodes page 38

Fast recovery diodes

Hitachi Energy's comprehensive family of fast recovery diodes is optimized for enhanced Safe Operating Area (SOA) and controlled (soft) turn-off recovery. This makes these diodes very well suited for all converter applications.

The diodes are typically used in combination with IGCTs and GTOs as free-wheeling and clamp diodes, thus enabling full IGCT and GTO performance.

Our L-housing fast recovery diodes optimally match press-pack IGBT and IEGT applications where a di/dt of up to $5\text{ kA}/\mu\text{s}$ is required.

Fast recovery diode recommendations for various applications can be found in the application note – Applying fast recovery diodes. The latest version is available at www.hitachienergy.com/semiconductors

Rectifier and avalanche diodes

Hitachi Energy's two families of high-power rectifier diodes – standard rectifier diodes and avalanche diodes – are well-known for their outstanding reliability and excellent nominal and surge current capabilities.

The standard rectifier diodes are optimized for line frequency and low on-state losses. Their main applications are rectifiers for large AC drives, aluminum smelting and other metal refining as well as trackside supply.

The avalanche diodes are self-protected against transient overvoltages, offer reduced snubber requirements and feature maximum avalanche power dissipation. They are frequently used for input rectifiers in traction converters or high-voltage power rectifiers.

For safe and easy parallel or series connection, both types of diodes are available in groups of similar V_F or Q_{rr} , respectively.

Welding diodes

Almost every second car driving in Europe has been fabricated using Hitachi Energy welding diodes, as most of the major welding equipment manufacturers rely on Hitachi Energy's quality, reliability and performance.

Hitachi Energy's comprehensive product range offers medium frequency (up to 2 kHz) and high frequency (up to 10 kHz) welding diodes. They all feature very low on-state voltage and very low thermal resistance. In addition, they are available in light package, thin and hermetically sealed ceramic housings or even housing-less, another welcomed feature for equipment that is mounted directly on robot arms.

Thyristors

High-power thyristors are used in applications ranging from 100 kW drives up to HVDC stations rated above 10 GW.

Since many applications use antiparallel connected thyristors, we introduced the bi-directionally controlled thyristor (BCT), which consists of two integrated antiparallel thyristor functions on one silicon wafer.

Hitachi Energy offers the following thyristor families:

- Bypass thyristor page 41
- Phase control thyristors (PCTs) page 42
- Bi-directionally controlled thyristors (BCTs) page 46

Bypass thyristor

The bypass thyristor is a new semiconductor device that offers three modes of operation:

- Normal operation: Device is blocked permanently.
- Protection mode: Device is irreversibly shorted by a surge current event (I_{TSM} / I^2t) triggered through the gate.
- SCFM mode: Continuous stable long-term short circuit mode.

A typical application is short-circuiting faulty cells in a multilevel converter topology (MMC). The thyristor housing will not rupture when passing currents up to, or exceeding, 363 kA or 217 MA²s. After a fault, the device operates as a stable short circuit for more than a year.

Part number	V_{DRM} (V)	V_{DCN} (V)	I_{TSM} (kA)	Package (mm)
5STP 10L8500	8400	4000	290	L

Drawings see page 44.

Please refer to page 64 for part numbering structure.

PCTs

Phase control thyristors

Phase control thyristor has been the backbone of the high-power electronics industry since its introduction about 50 years ago and has set benchmark reliability records over many years.

The field of PCT applications ranges from kW drives and MW rated line commutated frequency converters and electrolysis applications such as aluminum, copper or hydrogen, to GW converters for HVDC transmission.

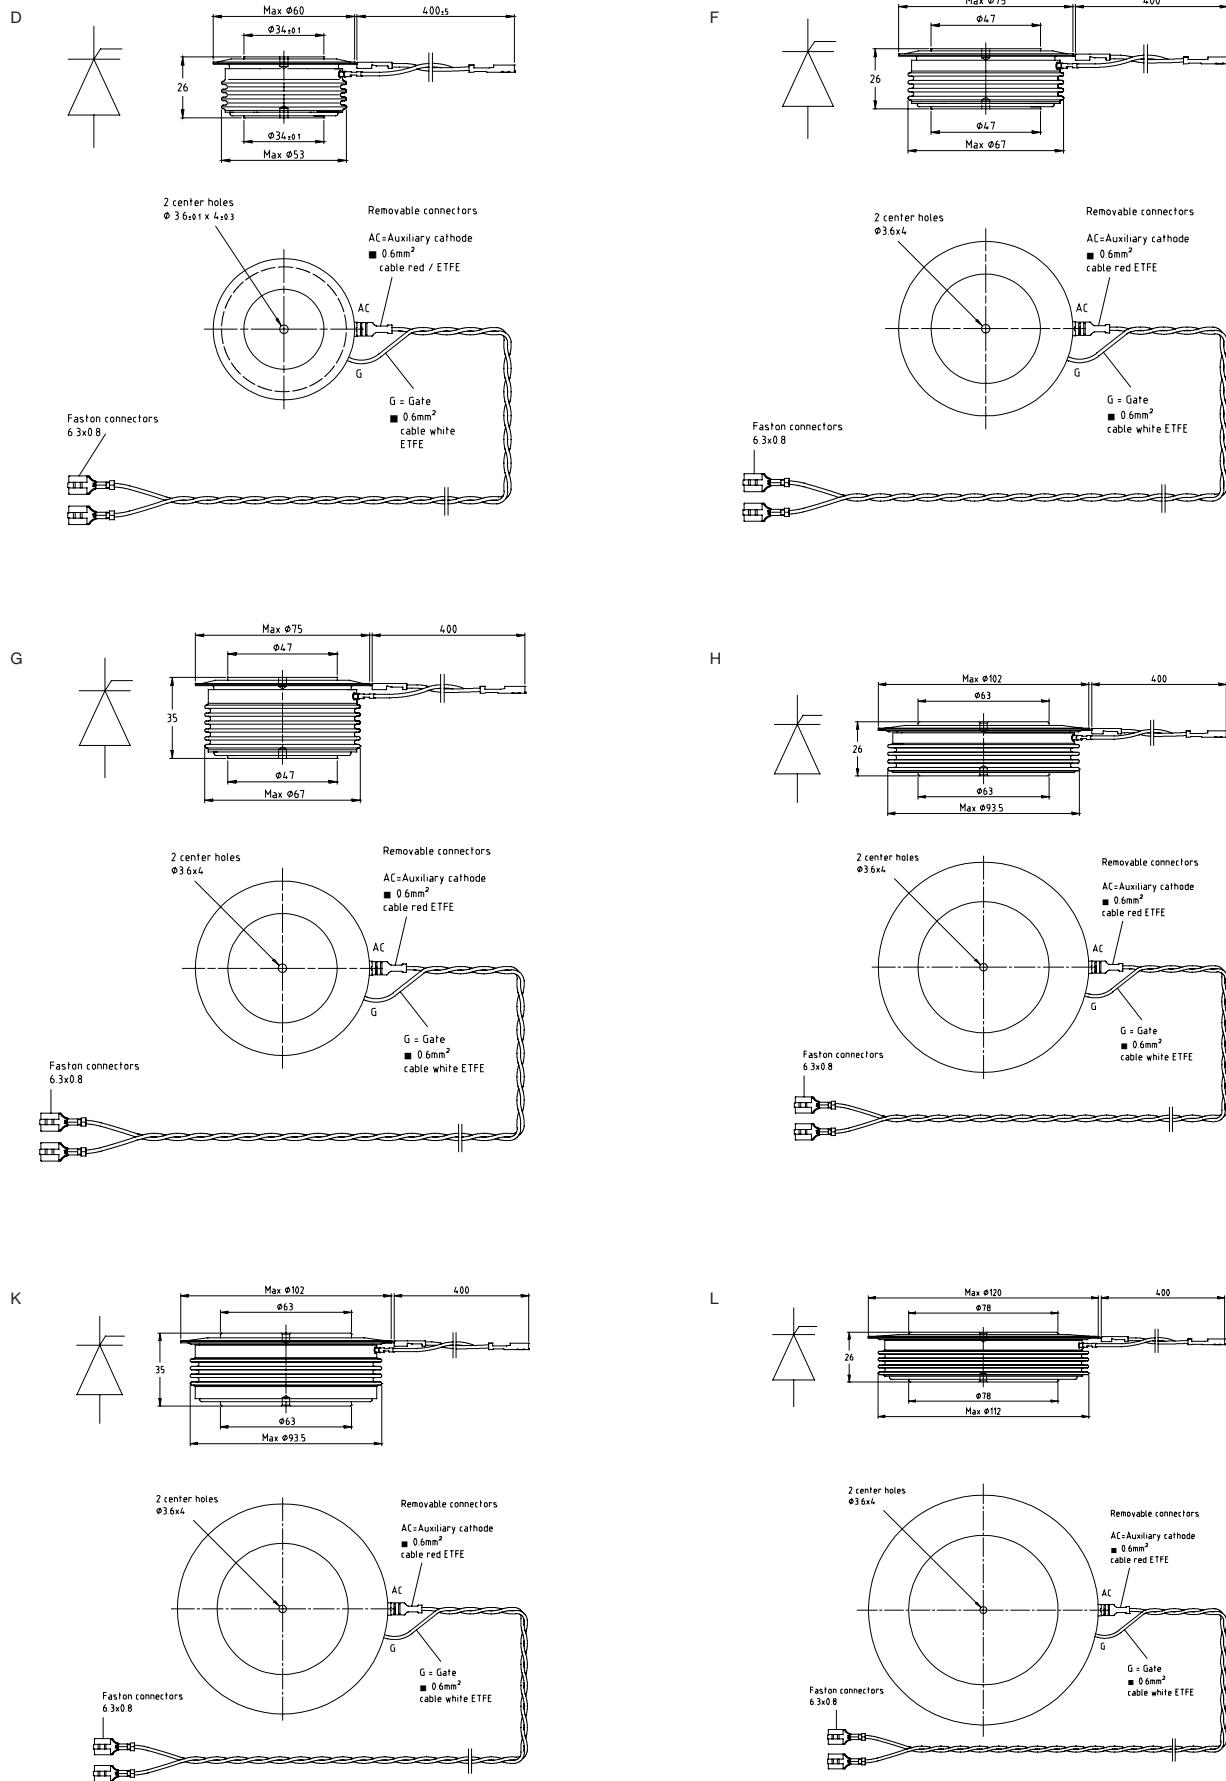

Hitachi Energy offers the most complete range of high-power thyristors, including 6" devices. New products continue to be developed with focus on minimizing overall losses and maximizing power ratings.

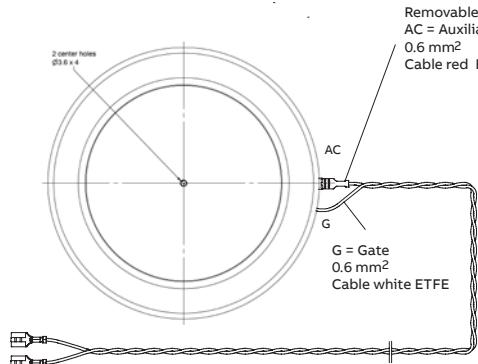

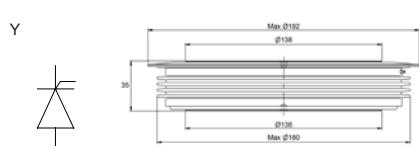

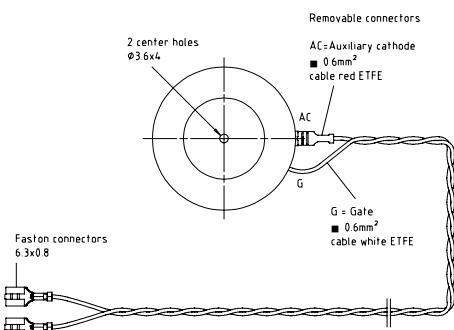

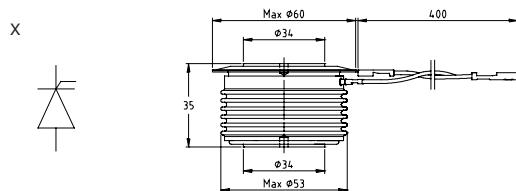

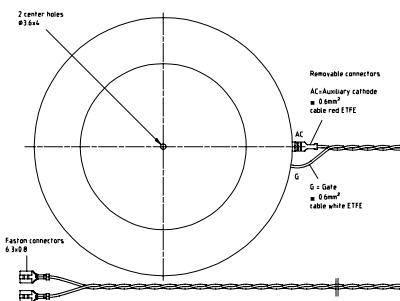

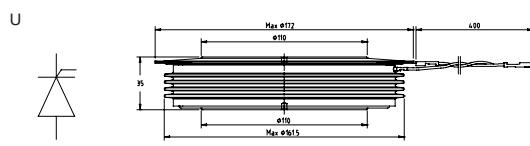

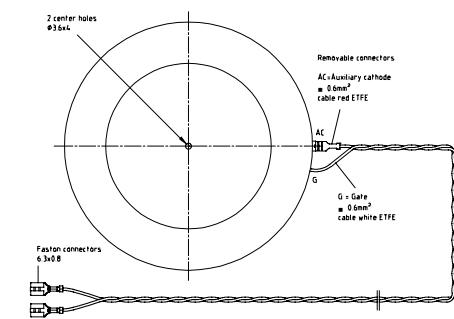

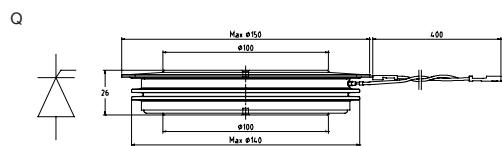

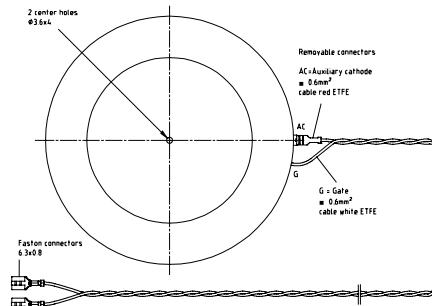

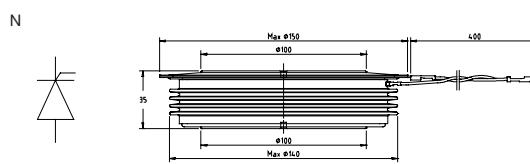

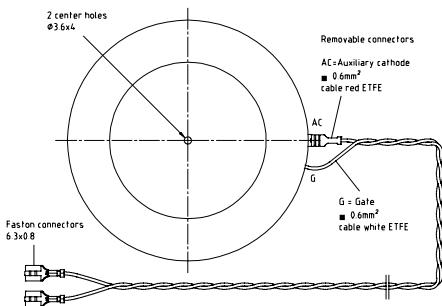

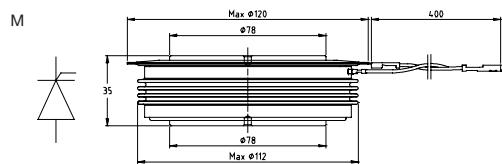

Applications using two antiparallel thyristors can take advantage of Hitachi Energy's innovative bi-directionally controlled thyristors (BCTs) that incorporate two antiparallel thyristors in a single housing (see page 46).

BCTs

Bi-directionally controlled thyristors

Improved volume consumption and reduced part count for SVC, 4-quadrant DC-drive or soft starter equipment in the magnitude of 25 percent compared with equally rated PCT-solutions are possible with Hitachi Energy's BCTs – without jeopardizing reliability and performance.

Hitachi Energy's innovative bi-directionally controlled thyristor (BCT) features two monolithically integrated antiparallel thyristors in a single housing. The two thyristor halves are individually triggered and have a separation region enabling the design of high-voltage devices with the dynamic capability of discrete devices.

The BCT is designed, manufactured and tested using the same philosophy, technology and equipment as the well-established PCT (page 42), thus reaching the same levels of performance and reliability.

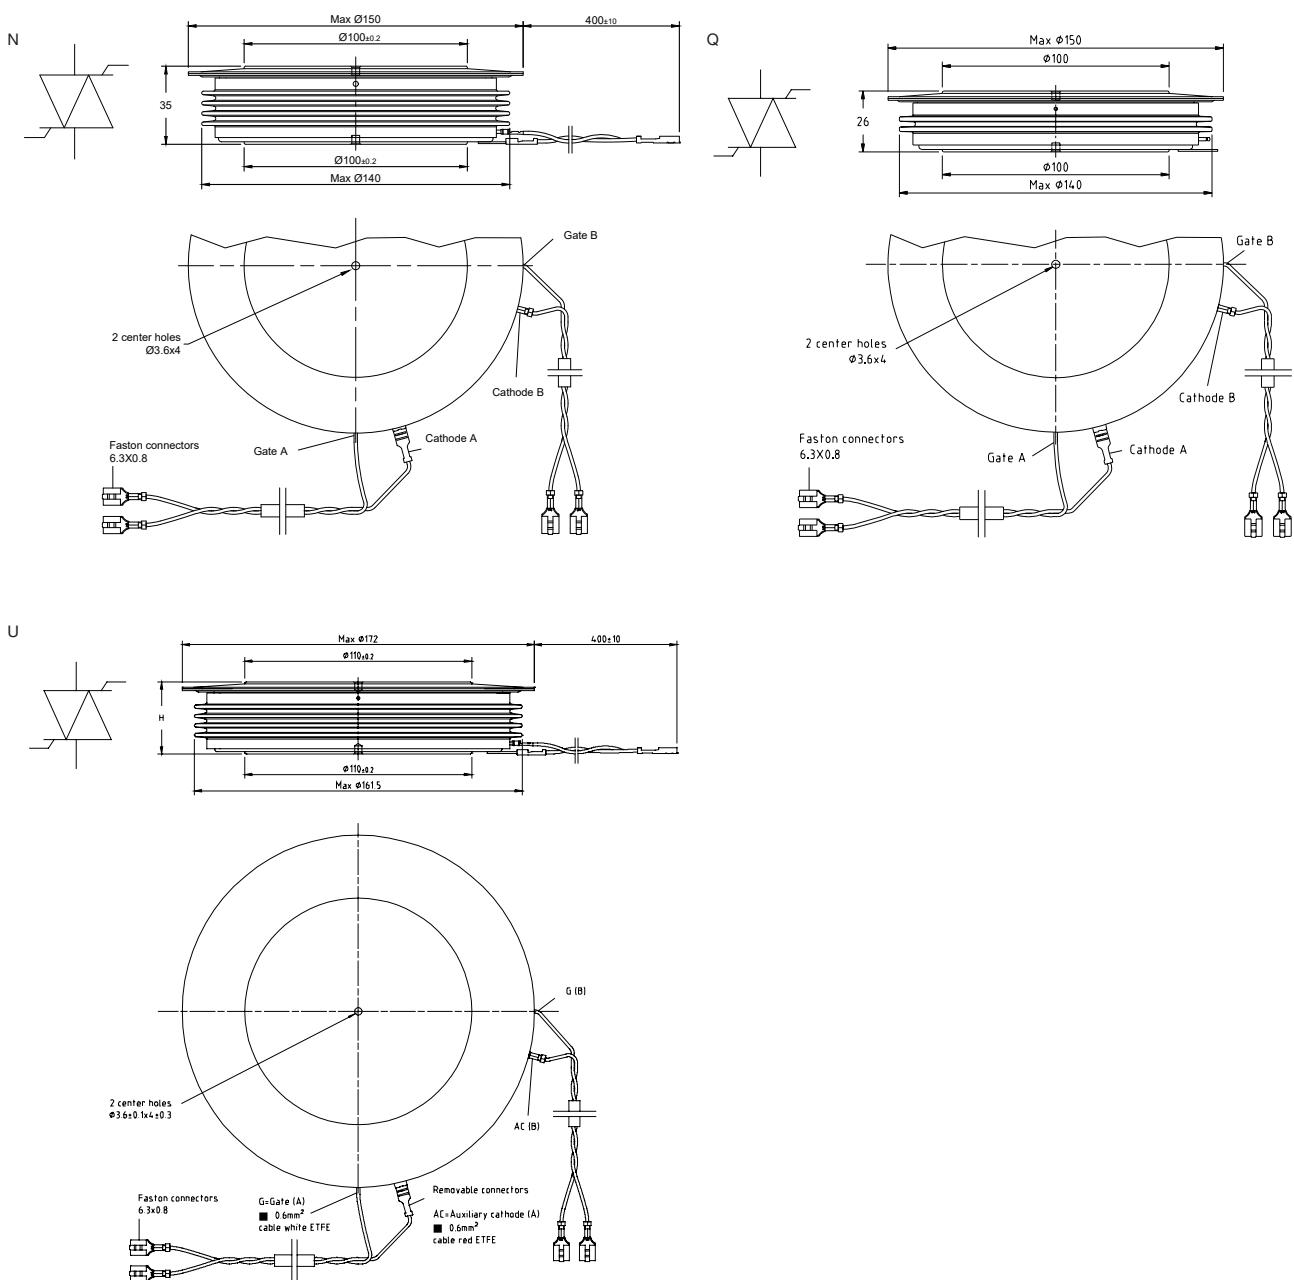

A table of replacement of PCTs by BCTs is given in the BCT application note which can be found at www.hitachienergy.com/semiconductors.

IGCTs

Integrated gate-commutated thyristors

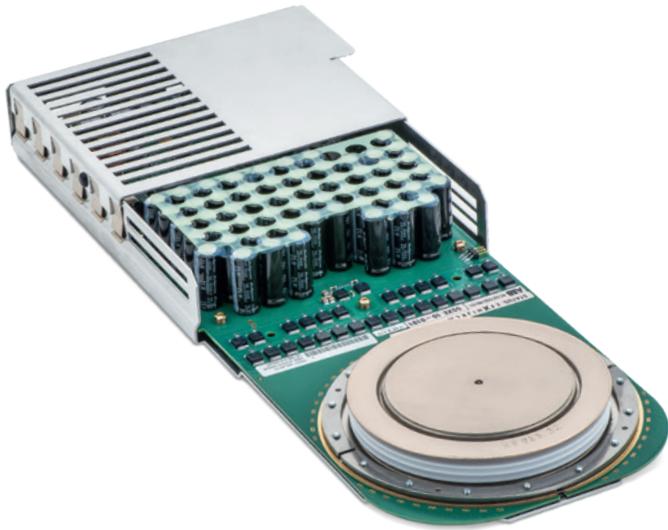

Within 20 years of its introduction, the IGCT has established itself as the semiconductor of choice for high-power frequency converters by meeting the requirements of today's demanding applications.

Hitachi Energy's IGCTs are used in a multitude of applications due to their versatility, efficiency and cost-effectiveness. With their low on-state voltage, they achieve the lowest running costs by reaching inverter efficiencies of 99.6 percent and more.

Single inverters of over 15 MVA can be realized without series or parallel connection, thus achieving the highest inverter power densities in the industry.

The number of applications featuring IGCTs is manifold: off-shore wind generation, medium-voltage drives (MVDs), static frequency converters (SFC), marine drives, co-generation, pulse power (PP) and STATCOMs, to name just a few.

An example of remarkable performance using IGCTs was achieved with the world's most powerful frequency converter (100 MVA) for variable speed pumped hydropower application installed in the Grimsel 2 power plant in the Swiss Alps.

Fast recovery diode recommendation

For all asymmetric and reverse conducting IGCTs, Hitachi Energy offers matching fast recovery, neutral point (NPC) and clamp diodes.

Dimensions in mm

The actual choice of the diode depends on the specific application. Please see application note 5SYA 2064, Applying fast recovery diodes, on www.hitachienergy.com/semiconductors.

GTOs

Gate turn-off thyristors

One might be assuming that the rapid advance of the IGBT would spell an equally rapid end to the GTO era. The demand for these devices, however, is still strong today.

Hitachi Energy offers a broad portfolio of asymmetric GTOs with proven field reliability in various traction and industrial applications.

Asymmetric GTOs are divided in two categories: Fine pattern and standard. Fine pattern GTOs with buffer layer have exceptionally low on-state and dynamic losses and are optimized for fast switching.

Assemblies for high power applications

Hitachi Energy designs and produces complete solid-state assemblies containing the semiconductor device, driving circuit, triggering, mechanical clamping and cooling, ensuring performance with application-specific testing.

Hitachi Energy offers assemblies for a variety of applications from research & development and laboratory use to production. The semiconductor devices are designed to switch currents with very fast rise times (high di/dt) for pulse power applications. They feature rapid turn-on, very high current ratings and high blocking voltages.

Due to higher reliability and lower maintenance costs, Hitachi Energy's optimized assemblies are increasingly replacing thyratrons and ignitrons.

We offer assemblies rated up to 120 kV and 200 kA using series and parallel connections. Custom build assemblies are available on request.

Closing Switches

Applications:

- Radar power supply switches
- Food sterilisation
- Rock blasting
- DgNOx/DeSOx dust precipitation
- Laser power supplies

Part number	Technology	Cooling	Max. Voltage [kV]	dl/dt [kA/μs]	I _{max} [kA]	Pulse width [μs]	Rep. Rate [Hz]
5SVC 032700E00	High dl/dt IGCTs	Air	5.6	6	1.2	2	1350

Test systems for high-power semiconductors

Hitachi Energy designs, manufactures and offers CE compliant customized power semiconductor test systems.

Hitachi Energy offers test systems for various environments like research & development, laboratory, production or failure analysis. Highest quality assurance, safe handling, as well as remote or on-site service capability are guaranteed.

High-power semiconductor test systems

Hitachi Energy offers static and dynamic production test systems for most types of power semiconductor devices like diodes, PCTs, BCTs, GTOs, IGCTs and IGBTs. They can handle dies, substrates, submodules, modules, wafers and press-pack devices. Also reliability test systems for high temperature reverse bias, intermittent operating life or surge current tests are available. Auxiliary tester parts include clamping, capacitor discharge, pre-heating, data acquisition and parameter extraction units as well as programmable IGBT and thyristor gate units.

Parameters

The Hitachi Energy test systems cover the range of up to 14 kV and 10 kA and use configurable stray inductances down to 60 nH. During testing, the clamped device under test (DUT) can be precisely heated up to 200 °C for production systems or cooled down to -40 °C in an environmental chamber for engineering systems. The clamping units can handle devices up to 240 mm in diameter and can apply a clamping force of up to 240 kN.

Automation

Our test systems are designed for easy integration into automated handling equipment. The test system's software is compatible to commercial control systems such as manufacturing execution systems (MES) and computer-aided quality assurance (CAQ).

	Blocking voltage AC or DC	Gate characteristics	On-state, forward voltage	Reverse recovery charge	Critical dV/dt	Circuit-commutated turn-off time	$V_{\text{clsat}} / V_{\text{on/off}}$	Turn-on / turn-off	Flatness baseplates
BiPolar test systems									
Thyristor and diode static / dynamic	X	X	X	X	X	X			
GTO and diode static	X	X	X					X	
GTO and diode dynamic	X			X				X	
IGBT & SiC MOSFET test systems									
IGBT & SiC MOSFET and diode dies static	X	X					X		
IGBT & SiC MOSFET and diode substrates static / dynamic	X	X		X			X	X	
IGBT & SiC MOSFET and diode modules static	X	X					X		
IGBT & SiC MOSFET and diode modules dynamic					X			X	
IGBT & SiC MOSFET mechanical properties									X

Reliability test systems

- High temperature reverse bias
- Intermittent operating life / Power cycling
- Surge current
- Frequency tester

Auxiliary unit

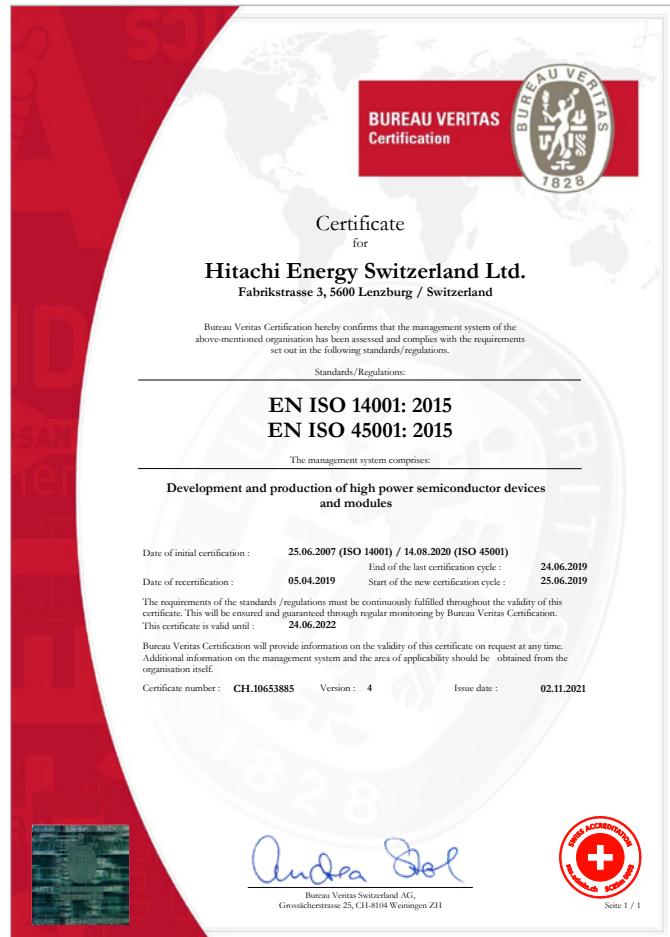

- Clamping unit
- Capacitor discharge unit
- Pre-heating unit
- Programmable IGBT and thyristor gate units
- Data acquisition and parameter extraction units

Further information

Certificates

Hitachi Energy is committed to the highest ethical, environmental and business standards. The company has been awarded the ISO certifications for manufacturing, design and development of high-power semiconductor devices and modules (ISO 9001 and 14001).

Further information

Product Environmental Compliance Information

With reference to the Regulation (EC) N° 1907/2006, issued by the European Union for the Registration, Evaluation, Authorization and Restriction of Chemicals (REACH), please be aware that:

- During normal and reasonably foreseeable conditions of use, products and related accessories, which are articles according to REACH, manufactured by Hitachi Energy Switzerland Ltd., Semiconductors and/or Hitachi Energy Czech Republic s.r.o. do not intentionally release any substance or preparation (mixtures);
- Hitachi Energy Switzerland Ltd., Semiconductors and/or Hitachi Energy Czech Republic s.r.o. continuously assess their products for content of Substances of Very High Concern (SVHC), as included in the "Candidate List" by the European Chemicals Agency (ECHA);
- Hitachi Energy Switzerland Ltd., Semiconductors and/or Hitachi Energy Czech Republic s.r.o. continuously undertake communications throughout their supply chain in order to collect information about suppliers' compliance with REACH Regulation.

For further information about product specific environmental compliance information, please contact us.

Hitachi Energy Switzerland Ltd., Semiconductors

Further information

Symbols

Symbol	Description
dI/dt_{max}	Maximum rate of rise or decline of on-state current
dV/dt	Maximum rate of rise of off-state voltage
F_m	Mounting force
I_C	DC collector current
I_D	DC drain current
I_{CM}	Peak collector current
I_F	Diode nominal mean forward current
I_{FAVM}	Max. average forward current (180° sine wave)
I_{FSM}	Max. surge peak forward current for a 180° sine wave; no voltage reapplied after surge
I_{RM}	Max. peak avalanche current for a single 180° sine wave pulse
I_{RMS}	Max. rms on-state current (AC full wave)
I_{rr}	Max. (typ. for IGBT diode) reverse recovery current
I_T	On-state current thyristor
I_{TAVM}	Max. average on-state current (180° sine wave)
I_{TGQM}	Max. turn-off current
I_{TSM}	Max. surge peak on-state current for a 180° sine wave; no voltage reapplied after surge
P_{RSM}	Max. surge avalanche power dissipation (single pulse)
Q_{rr}	Max. reverse recovery charge
$R_{DS(on)}$	Drain-source on resistance
r_F	Forward slope resistance
r_T	On-state slope resistance
R_{thCH}	Thermal resistance case to heatsink
R_{thJC}	Thermal resistance junction to case
R_{thJH}	Thermal resistance junction to heatsink
T_C	Case temperature
t_q	Turn-off time
T_{VJ}	Junction temperature
T_{VJM}	Max. junction temperature
V_{CES}	IGBT collector-emitter voltage
V_{CESat}	Collector-emitter saturation voltage
V_{DC}	Max. DC voltage rating for 100 FIT, 100 percent duty
V_{DRM}	Max. repetitive peak forward blocking voltage
V_{DSS}	Drain-source voltage
V_F	Forward voltage drop
V_{FO}	Forward threshold voltage
V_{Fmax}	Max. forward voltage drop
V_{Fmin}	Min. forward voltage drop
V_{GIN}	Input voltage of IGCT gate drive
V_R	Symmetrical peak avalanche voltage at a sinusoidal current pulse with 20 A peak, 10 µs pulse width and 60 °C junction temperature
V_{RM}	Max. repetitive peak blocking voltage
V_{RRM}	Max. repetitive peak reverse blocking voltage
V_{RSM}	Max. surge peak reverse blocking voltage
V_T	On-state voltage drop
V_{TO}	On-state threshold voltage
